05 Inside a design

01

One photo or a whole folder

The background remover finds the person, product, pet or logo in a photo and removes everything else. It runs **on your own device** — your photos are never uploaded — and it is free with no watermark.

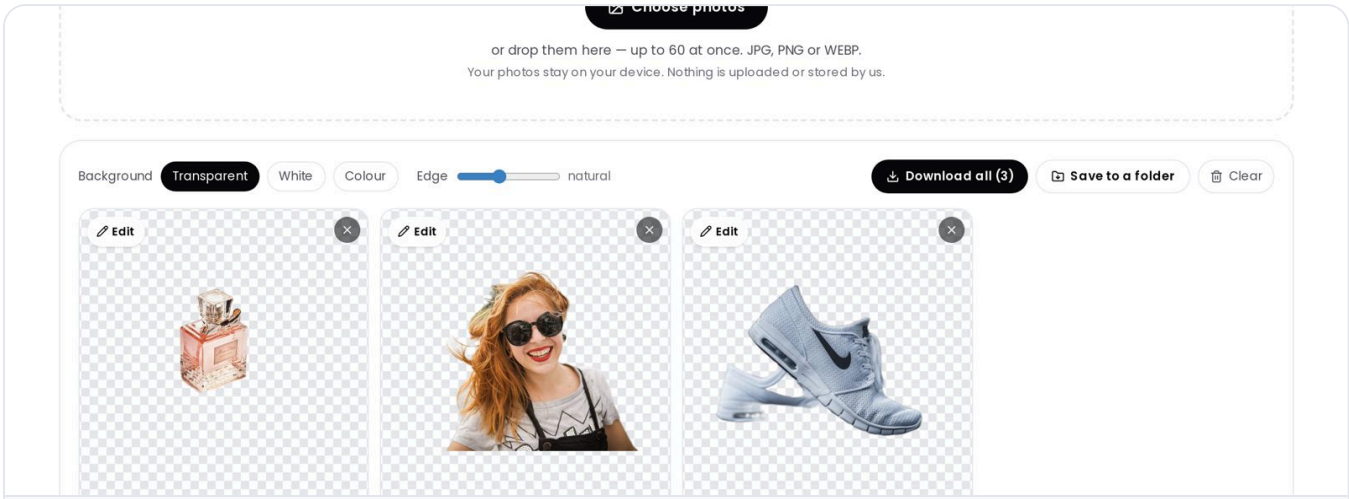

Tools → Remove background.

1. Open **Tools → Remove background** in the top menu.
2. Tap **Choose photos** or drop up to 60 photos on the page (JPG, PNG or WEBP).
3. The first photo takes a few seconds while the remover loads; the rest follow one after another.
4. Choose the background for all photos: **Transparent** (PNG), **White** or any **Colour** (JPG).
5. Use **Edge** to make all edges sharper or softer.

02

Results, saving and the Edit button

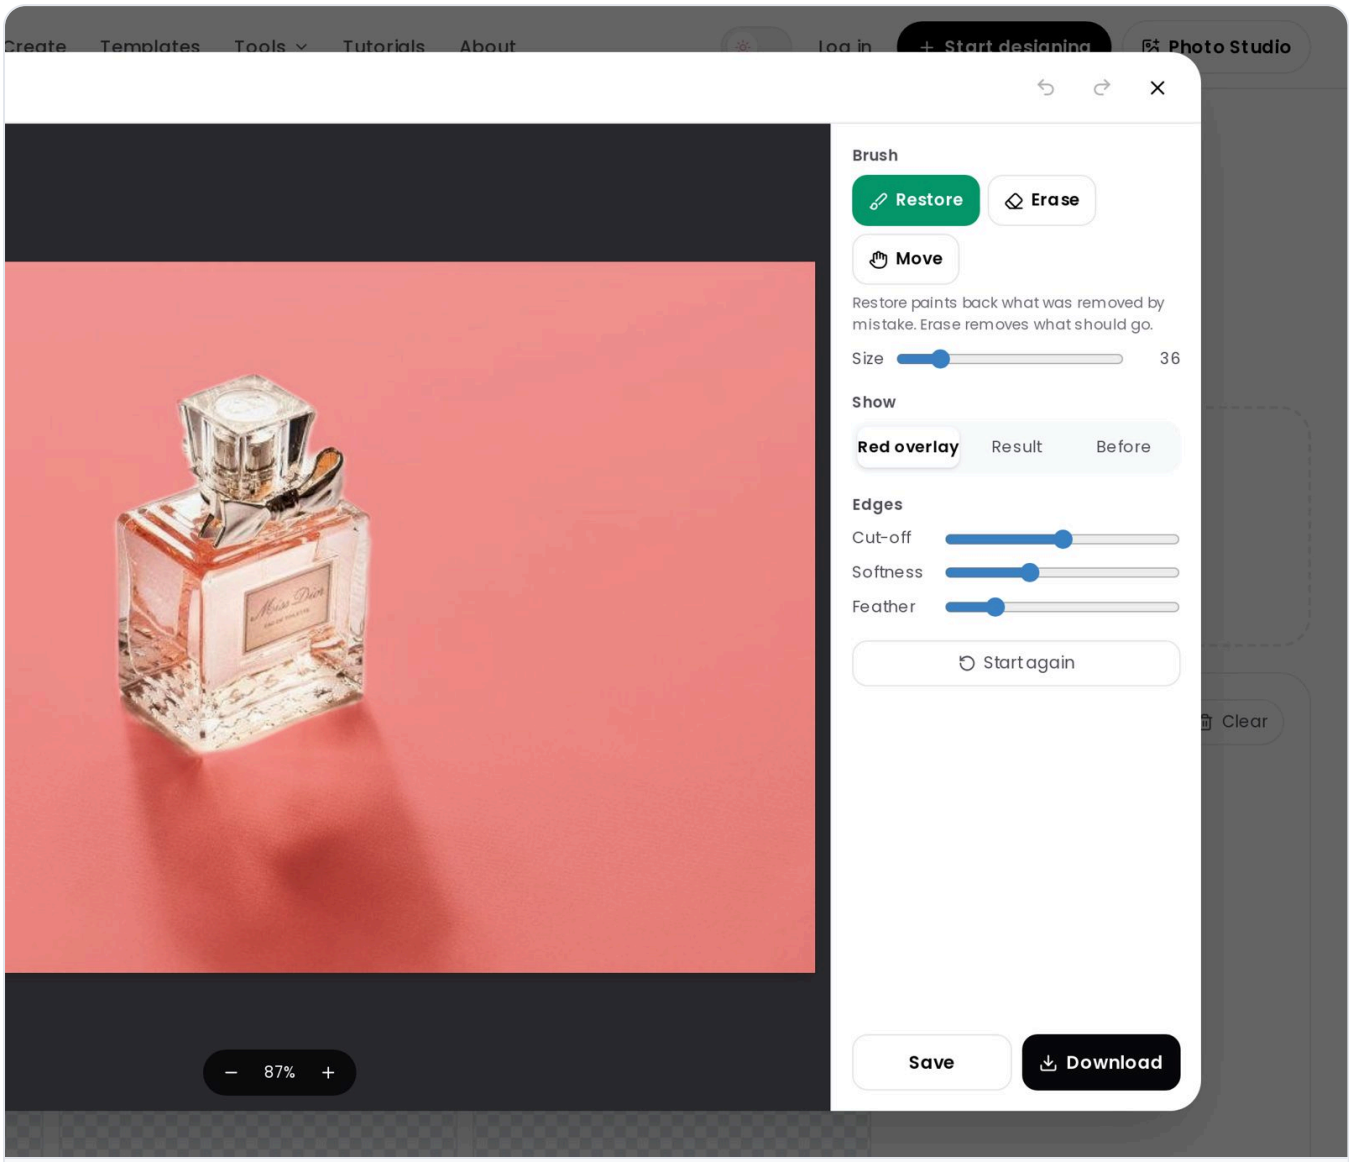

Every finished photo has ✎ Edit (touch up), × (remove from the list) and a download button.

1. Download one photo with the **PNG** / **JPG** button under it.
2. **Download all** saves every photo in one ZIP file.
3. On a computer, **Save to a folder** writes them straight into a folder you choose.
4. If a photo needs correcting, tap ✎ **Edit** on it.

03

Touch up: Restore and Erase

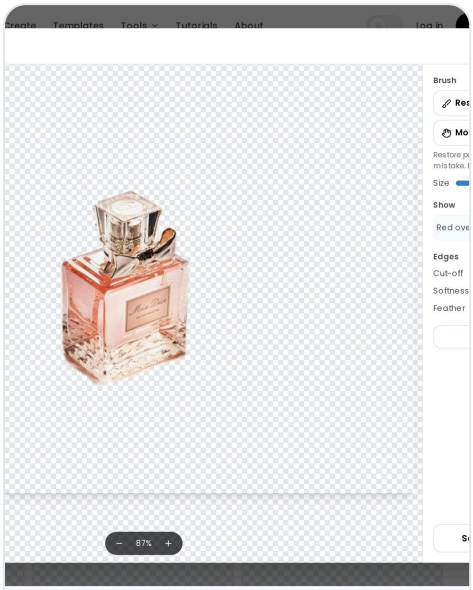

The touch-up editor in Red overlay view: red shows exactly what will be removed.

Like the mask brush in a professional photo editor, the touch-up editor lets you correct the cut-out by hand:

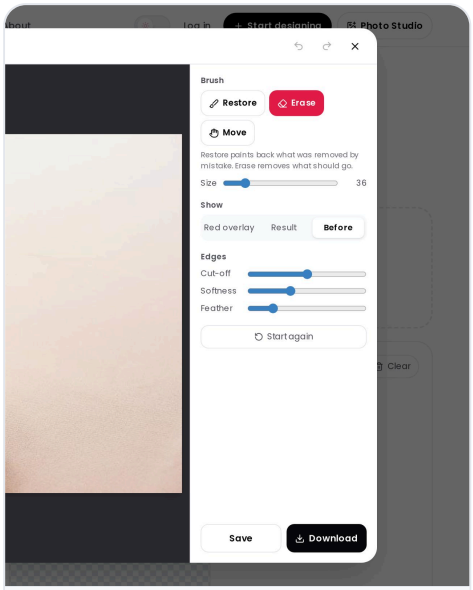

Restore (green)	Paint over parts that were removed by mistake — a hand, hair, the edge of a product.
Erase (red)	Paint over background that is still there.
Move	Drag the picture around when zoomed in (also: middle mouse button).
Size	Brush size. With an Apple Pencil or pen, pressing harder paints wider.
Undo / Redo	At the top; every brush stroke can be undone.

04

Check the result

Result view.

Before view.

1. **Red overlay** — the original photo, with removed areas in red. Best for painting.
2. **Result** — the finished cut-out on the background you chose.
3. **Before** — the original photo.
4. Zoom with **+** / **−** at the bottom; tap the percentage to fit the photo again.

Edges

Cut-off	Higher keeps less (cleaner background), lower keeps more (safer for fine details).
Softness	How gently the edge fades — raise it for hair and fur.
Feather	Blurs the edge slightly so the cut-out blends into new backgrounds.

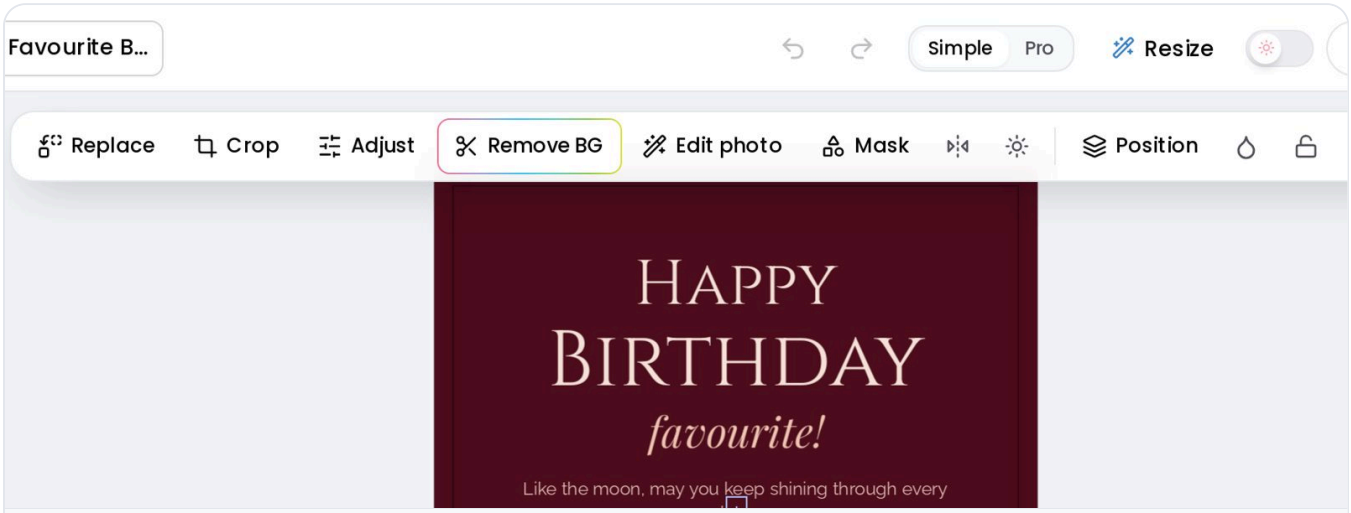

1. Tap **Save** to keep the corrections (the photo shows “Touched up”), or **Download** to save the picture straight away.
2. **Start again** clears all brush work and edge settings.

> **Tip** · Hair looks most natural with Softness around 40–60% and a little Feather. Products with hard edges look best with low Softness.

05

Inside a design

You can also remove a background inside the editor: tap a photo in your design, then **Remove BG** in the bar above the page. The same Restore / Erase brushes and edge settings appear; tap **Apply** to put the cut-out back into the design.

In the editor: tap the photo → Remove BG.

> **Tip** · Put the cut-out in front of a colour block or shape and add a soft shadow (Effects) — it instantly looks like a studio shot.

Now make something magical.
