MAGICAL TOUCH

GUIDE 04

COMPLETE GUIDE

Photo Studio

Every tool explained: adjustments, colour, looks, filters, retouching, selections, layers, live text effects, crop and print-ready export.

Contents

01 Open a photo or start blank

02 The Pro workspace

03 Adjust: light, colour and detail

04 Colour: levels, curves and HSL

05 Looks and filters

06 Retouch brushes

07 Selections and cut-outs

08 Layers

09 Live text and pro text effects

10 Shapes, gradients and colour tools

11 Crop, size and print

12 Save and export

01

Open a photo or start blank

Photo Studio is a complete photo editor in your browser — adjustments, colour grading, filters, retouching, selections, layers, live text, shapes, background removal and print-ready export. Everything runs on your own device; your photos are never uploaded to edit them.

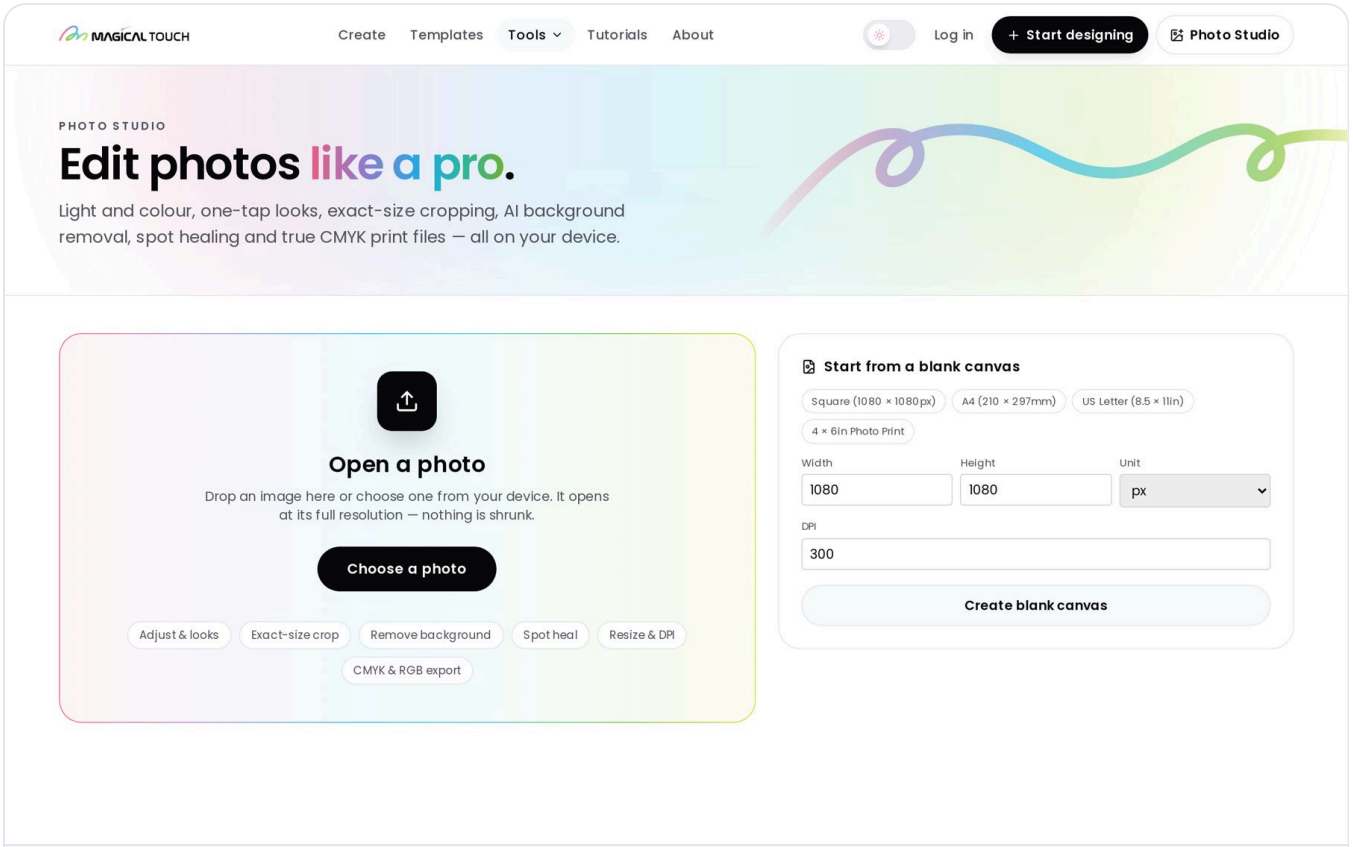

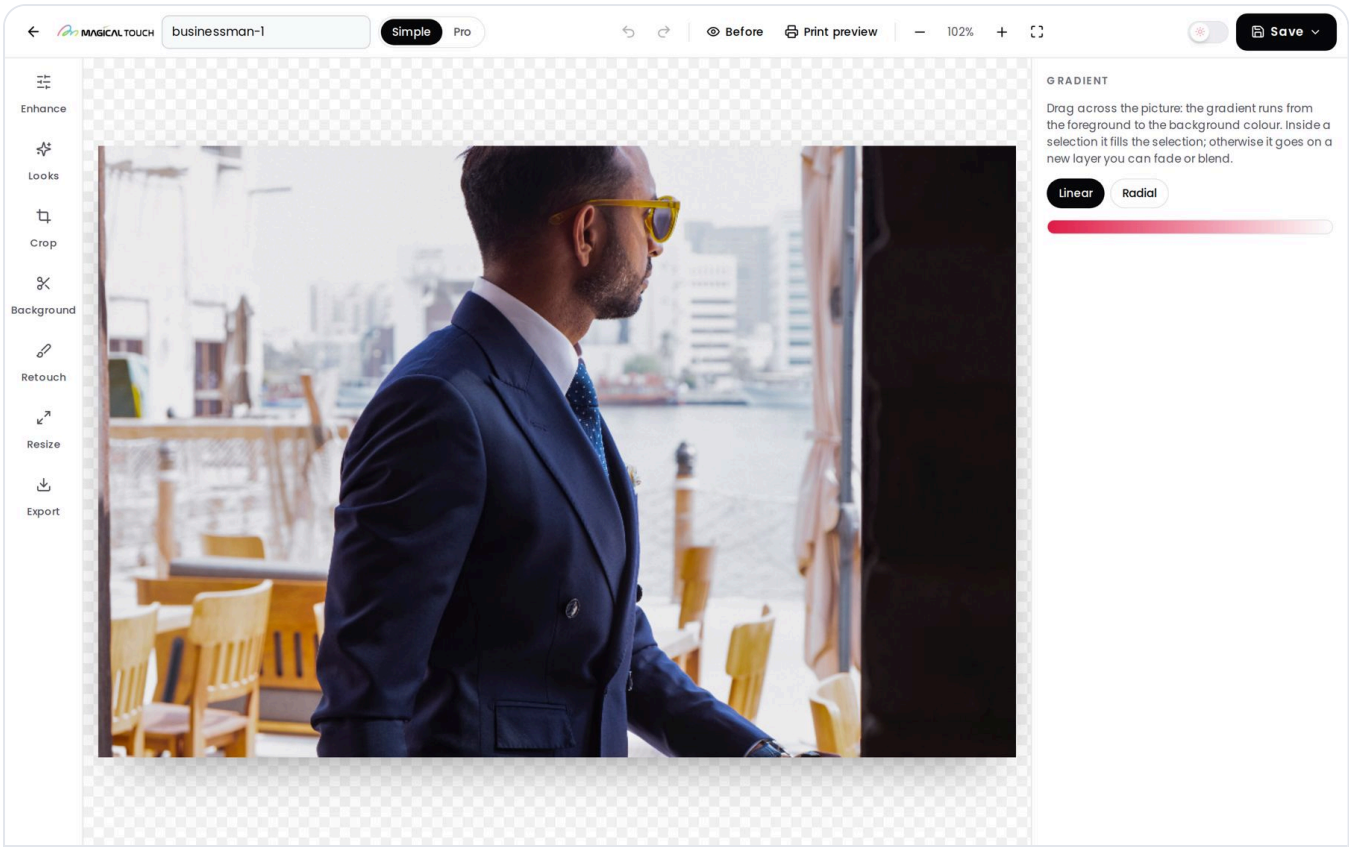

Photo Studio start page: open a photo, or create a blank canvas in any size.

1. Open **Photo Studio** from the top menu (or **Tools → Photo Studio**).
2. Tap **Choose a photo** or drop an image — it opens at full resolution.
3. Or **Start from a blank canvas**: choose a preset (square post, A4, US letter, 4×6 in print…) or type the width, height, unit and dpi.

Simple and Pro

The switch at the top changes the workspace. **Simple** shows big, friendly tools (Enhance, Looks, Crop, Background, Retouch, Resize, Export) — ideal on phones. **Pro** shows the full professional workspace with a tool bar, menus, panels, layers and history.

Simple mode: the essentials, one tap each.

02

The Pro workspace

Area	What it does
Menu bar	**File** (open, place picture as layer, export, quick download), **Edit** (undo, redo), **Image** (size, canvas, rotate, flip), **Layer**, **Select**, **Filter**, **View**, **Window**.
Tool bar (left)	Every canvas tool, with its keyboard shortcut shown on hover.
Options bar (top)	Settings for the tool you picked — size, mode, colour, shape type...
Panels (right)	**Properties**, **Adjust**, **Colour**, **Filters**, **Looks**; below them **History** and **Layers**.
Status bar	Zoom, pixel size, dpi and print size, cursor position and number of layers.

Keyboard shortcuts

V Move	M Marquee	L Lasso	P Pen	W Select subject
C Crop	I Eyedropper	J Healing brush	B Brush	E Eraser
G Gradient	K Paint bucket	R Blur	O Dodge	T Type
U Shape	H Hand	Z Zoom	Ctrl Z Undo	Ctrl] / Ctrl [Layer up / down

03

Adjust: light, colour and detail

Adjust panel.

Every adjustment applies to the **selected layer only** — other layers never change. Drag a slider and see the result live.

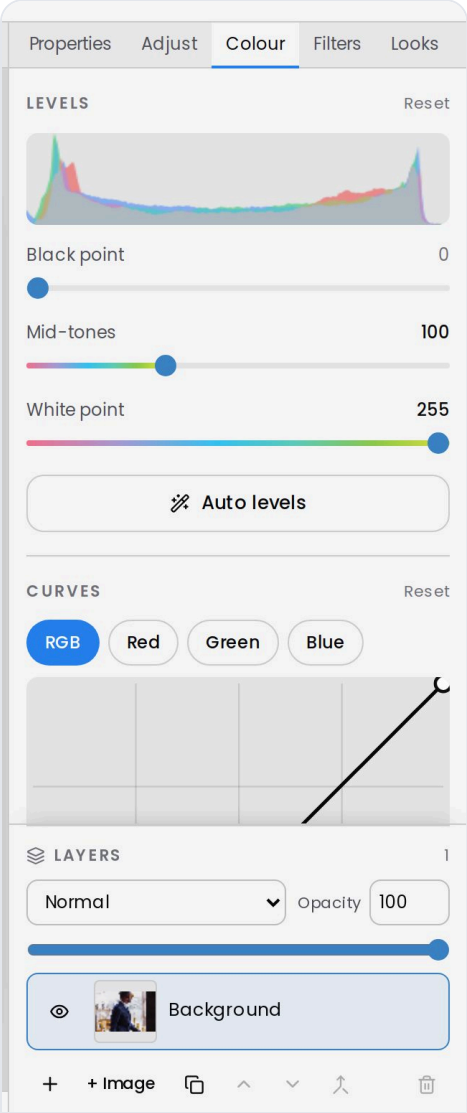

Light	Exposure, Contrast, Highlights, Shadows, Whites, Blacks.
Colour	Temperature (warm/cool), Tint, Vibrance, Saturation.
Detail & effects	Clarity, Sharpen, Soften / blur, Vignette, Film grain, Fade.
Auto	**Auto enhance** balances light and colour in one tap.

The note at the top says which layer you are adjusting. Pick another layer to adjust it separately.

> **Tip** · Use **Before** at the top to compare with the original at any time.

04

Colour: levels, curves and HSL

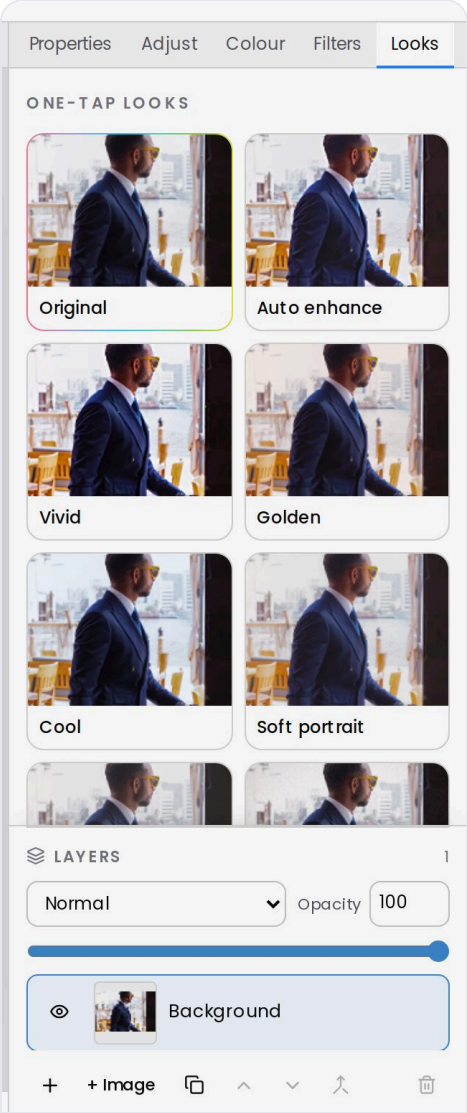

Colour panel: levels and curves.

Levels	Black point, mid-tones and white point with a live histogram. **Auto levels** sets them for you.
Curves	Drag points on the curve for the whole image (RGB) or for Red, Green and Blue separately — the classic way to add contrast or a colour cast.
HSL	Change the hue, saturation and lightness of one colour family only: Reds, Oranges, Yellows, Greens, Aquas, Blues, Purples, Magentas.

Tip · Make skies deeper with HSL → Blues: lower lightness a little and raise saturation.

05

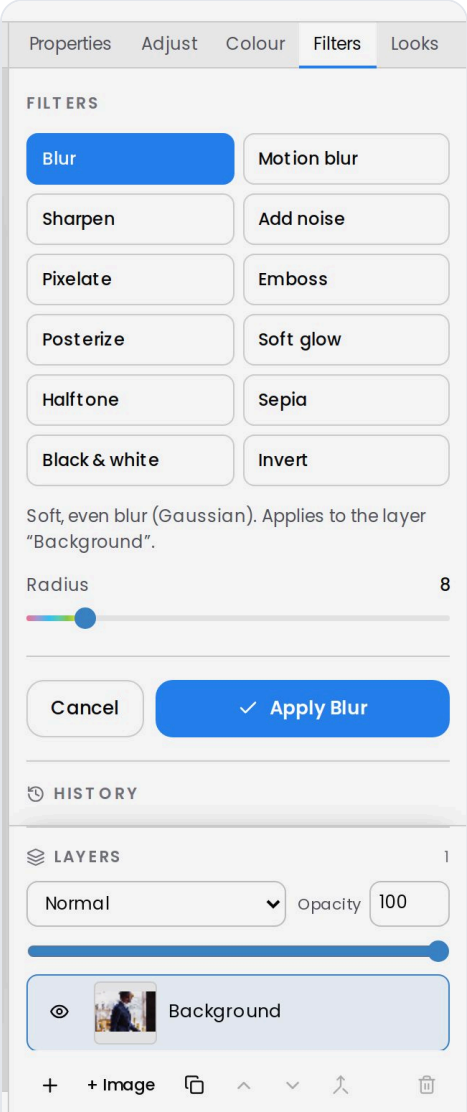

Looks and filters

Looks: one-tap styles.

Looks

One tap applies a complete style, previewed on your own photo: Auto enhance, Vivid, Golden, Cool, Soft portrait, Matte, Film, Dramatic, Black & white, Noir and Silver. Adjust any slider afterwards to fine-tune.

Filters panel.

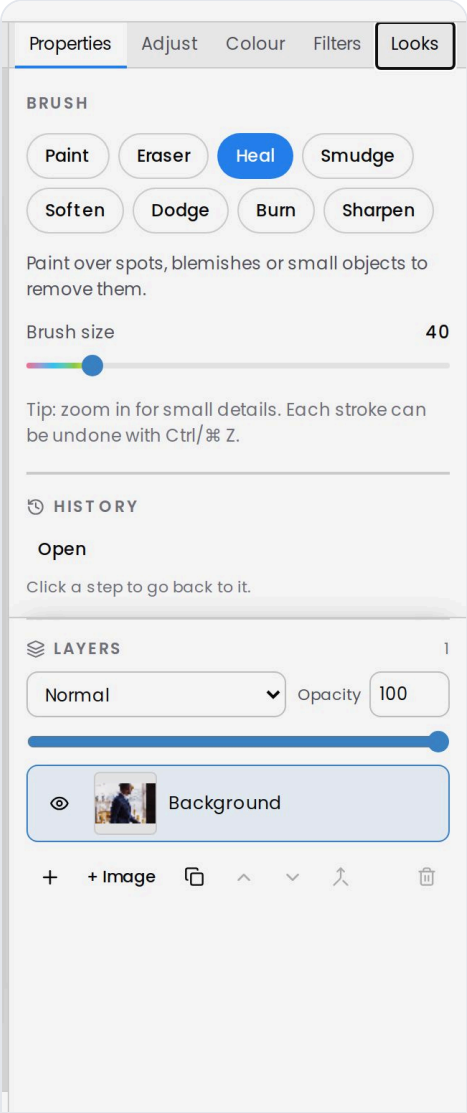

Filters

Blur / Motion blur	Soft even blur, or streaks in one direction.
Sharpen	Crisper edges (unsharp mask).
Add noise	Film-like grain.
Pixelate	Hide a face or number plate.
Emboss, Posterize, Halftone	Stamped, poster and printed-dot looks.
Soft glow, Sepia, B&W, Invert	Dreamy, vintage and graphic effects.

Filters work on the selected layer — or only inside a selection if you made one.

06

Retouch brushes

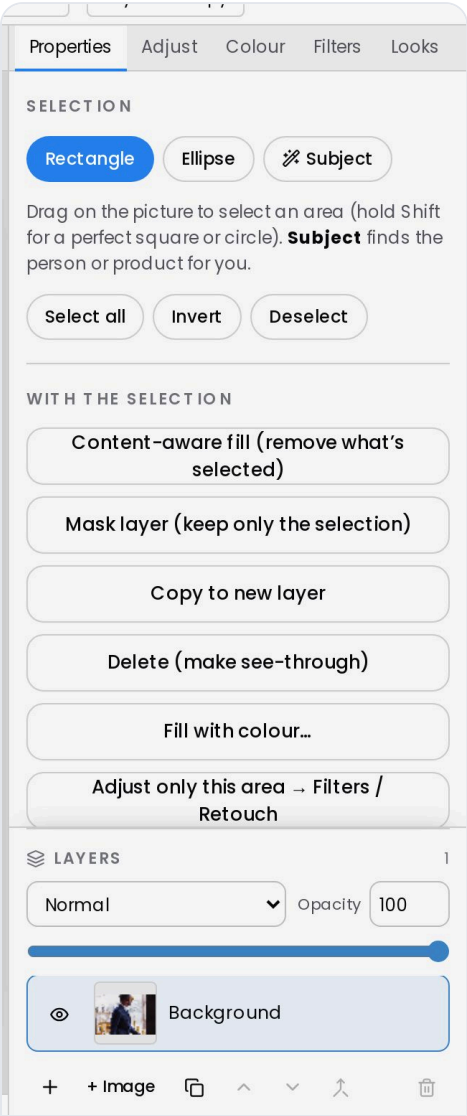

Brush panel with every retouch brush.

Healing brush	Paint over spots, dust, blemishes or small objects — they blend into the surroundings.
Brush	Paint in any colour on the selected layer, with size, opacity and hardness.
Eraser	Makes the layer see-through where you paint.
Smudge	Push and blend colours like a finger in wet paint.
Soften (Blur)	Smooth skin or a busy background.
Dodge / Burn	Lighten or darken by painting — eyes, highlights, depth.
Sharpen	Crisp up details such as eyes and textures.

Tip · Zoom in (Z or the + button) for small spots and use a brush a little bigger than the spot.

07

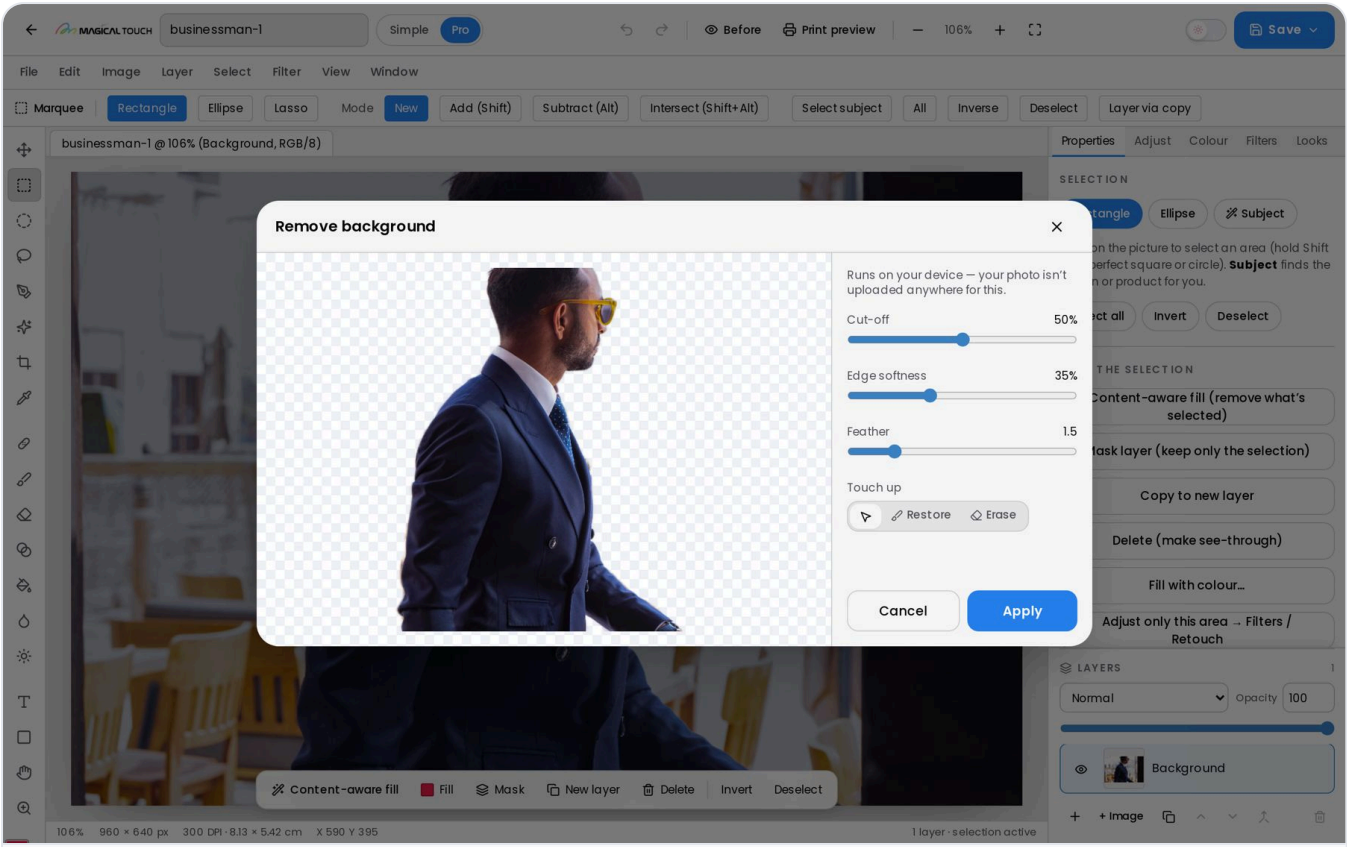

Selections and cut-outs

Selection panel.

Marquee	Rectangle or ellipse; hold Shift for a square or circle.
Lasso	Draw freehand, or click point to point.
Pen	Precise paths with curves for clean product cut-outs.
Select subject	Finds the person or product automatically.
Modes	New, Add (Shift), Subtract (Alt), Intersect; Select all, Invert, Deselect.

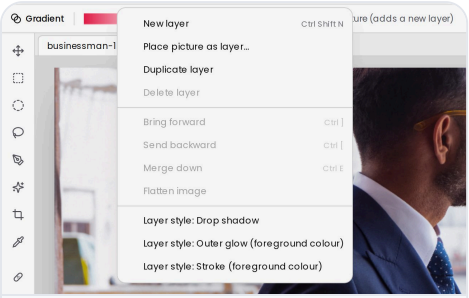

With a selection you can: **Content-aware fill** (remove what is selected), mask the layer, copy to a new layer, delete, fill with a colour, or apply adjustments and filters only inside it.

Background removal: Select subject / Background → cut-off, edge softness, feather, then Restore and Erase brushes to touch up.

08

Layers

Layer menu.

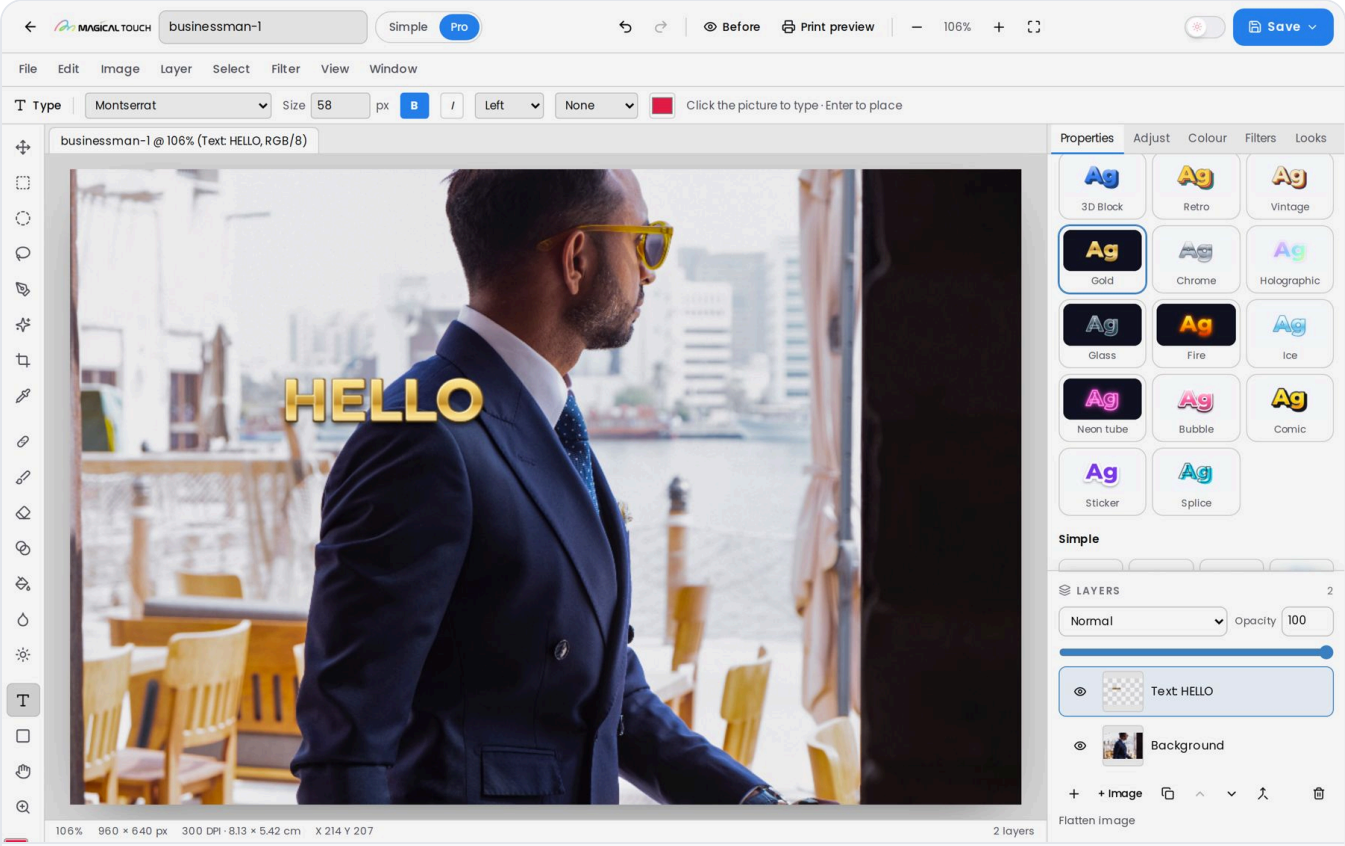

Work like a professional: keep each part on its own layer so you can change it later.

Add	New empty layer, picture as a new layer, duplicate, layer via copy.
Order	Bring forward / send backward, merge down, flatten image.
Blend & opacity	Normal, Multiply, Screen, Overlay, Soft light, Darken, Lighten, Difference, Colour, Luminosity.
Layer styles	Drop shadow, outer glow and stroke.
Move	Drag with Move (V). Parts pushed outside the canvas are only hidden — move them back and they return.

Tip · Each layer has its own adjustments: brighten a cut-out without touching the background.

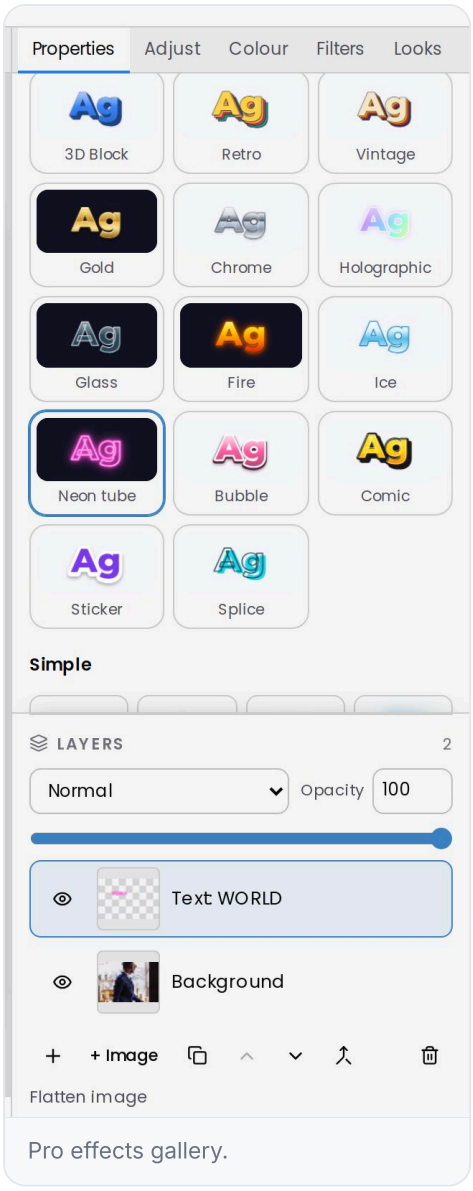

09

Live text and pro text effects

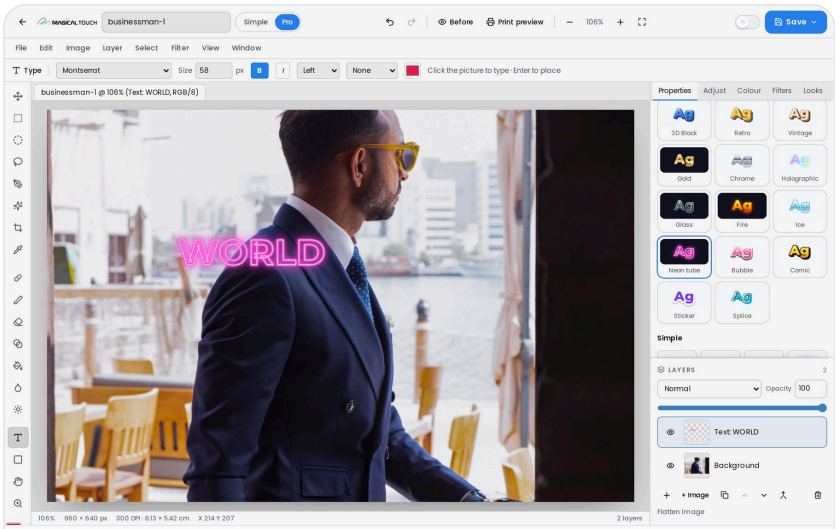

Text with the Gold effect — still live, editable text.

1. Pick **Type** (T) and click where the text should start. Type, then press **Enter** (Shift+Enter for a new line).
2. Choose the font, size, bold/italic, alignment, letter spacing and colour — the text updates live.
3. Pick a **Pro effect**: 3D Block, Retro, Vintage, Gold, Chrome, Holographic, Glass, Fire, Ice, Neon tube, Bubble, Comic, Sticker or Splice. Simple looks (shadow, lift, glow, outline, highlight) are there too.
4. To change it later, click the text again with Type, or double-click it with Move. Edit the words in the panel.

Pro effects gallery.

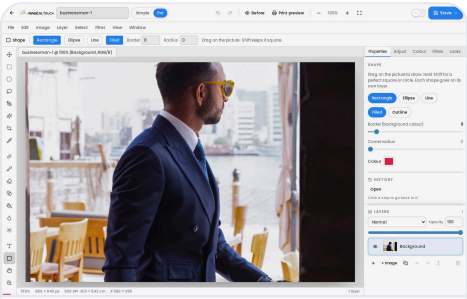

The same text switched to Neon tube and moved.

Tip · Text stays editable until you paint or erase on its layer — then it becomes pixels, like in professional editors.

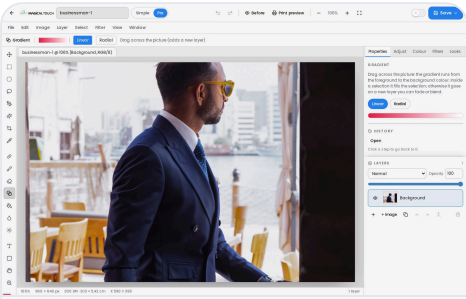

10

Shapes, gradients and colour tools

Shape (U)	Rectangle, ellipse or line; filled or outline, border width and corner radius. Each shape goes on its own layer.
Gradient (G)	Linear or radial, from the foreground to the background colour — on a new layer or inside a selection.
Paint bucket (K)	Fills similar colours with one click; set the tolerance.
Eyedropper (I)	Picks a colour from the photo.

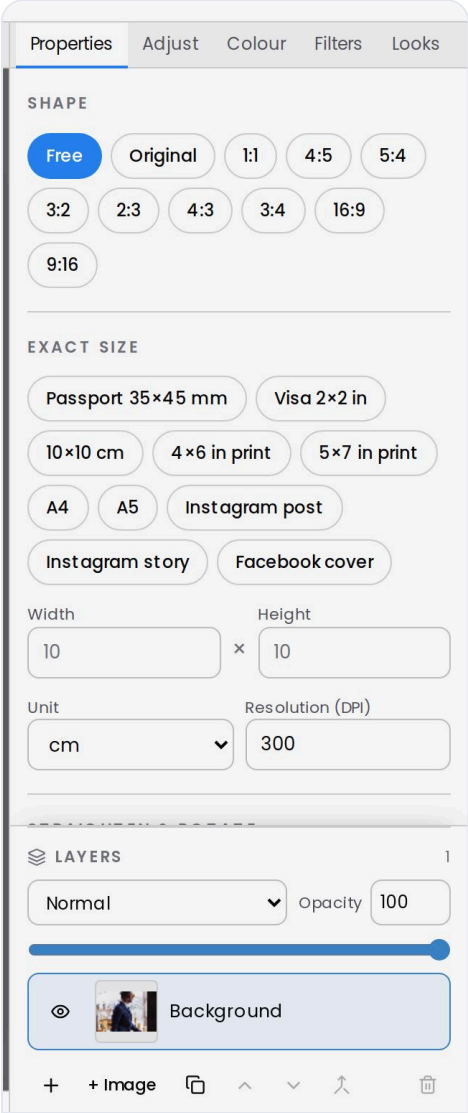

Shape tool.

Gradient tool.

11

Crop, size and print

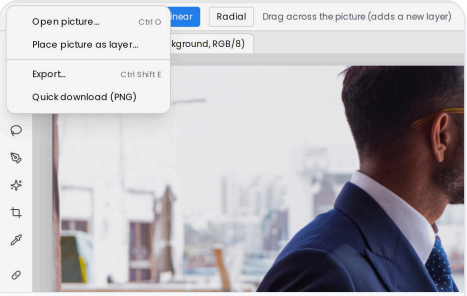

Crop panel: ratios and exact print sizes.

Crop (C)	Free, original, 1:1, 4:5, 5:4, 3:2, 2:3, 4:3, 3:4, 16:9, 9:16 — plus straighten.
Exact sizes	Passport 35×45 mm, visa 2×2 in, 10×10 cm, 4×6 and 5×7 in prints, A4, A5, Instagram post and story, Facebook cover.
Image size	Change pixels or print size (mm, cm, in) and resolution (dpi).
Canvas, rotate, flip	From the Image menu.
Print preview	See the real printed size before you export.

12

Save and export

File menu.

1. **Save** keeps the project (with layers and live text) in your account or as a .mtd file on your device.
2. **File → Export**: PNG (transparent), JPG, WebP, TIFF or PDF.
3. Choose **RGB** for screens or **CMYK** for print shops, and the dpi.
4. **Quick download** saves a PNG in one tap; **Apply to design** sends the photo into a design in the editor.

> **Tip** · Keep the .mtd project: you can reopen it later with every layer and text still editable.

Now make something magical.
